Day 29 – BIP Report with Parameter (Oracle Fusion Cloud)

Topic: Parameter Report – applying a filter to your report

Prepared by: Kawther Ali Almandhari

Concepts

- **Parameter Report:** applying a filter to your report. The parameter is added to the data set SQL as a bind variable (for example :IA_NAME), and the user enters its value when running the report.
- **Bind variable:** a name that starts with a colon (:) in the SQL. When you click OK, BIP detects it and offers to create a parameter with the same name.

Getting Started

Open BI Publisher

1. Open the URL: https://fa-euth-dev50-saasfademo1.ds-fa.oraclepdemos.com and sign in.
2. Go to **Tools > Reports and Analytics**.
3. Click **Browse Catalog**.
4. In the Folders pane, open **My Folders > KA** (my working folder).

Task 1 – Create Report with Parameter

Goal: edit the existing data model DM_ABSENCEMGMT_BU to add the parameter IA_NAME (filter on Ledger Currency Name), then run the existing report REPORT_ABSENCEMGMT_BU with this parameter.

A. Edit the existing Data Model

1. In **My Folders > KA**, find **DM_ABSENCEMGMT_BU** (description: Data model based on Absence Mgmt – Business Unit).
2. Click **Edit** under it. The data model opens on the Diagram tab and shows the group G_1 with its columns.
3. In the left Data Model pane, under **Data Sets**, click the data set **DM_BU_ABSENCE_MGMT**.
4. Click the **Edit (pencil)** icon on the Diagram toolbar. The Edit Data Set window opens (Data Source: Oracle BI EE, Type of SQL: Standard SQL).

B. Add the parameter to the SQL query

1. Go to the end of the SQL query and add the WHERE condition with the bind variable:

```
where "- Invoice Accounting"."Ledger Currency Name" = :IA_NAME
```

2. The full query after the change:

```
select "- Invoice Accounting"."Invoice Currency" as "Invoice Currency",
       "- Invoice Accounting"."Ledger Currency Name" as "Ledger Currency
Name",
       "- Invoice Accounting"."Ledger Currency" as "Ledger Currency",
       "- Invoice Accounting"."SLA Unrounded Entered Amount Debit" as
"SLA Unrounded Entered Amount Debit",
       "- Invoice Accounting"."SLA Unrounded Accounted Amount Credit" as
"SLA Unrounded Accounted Amount Credit",
```

```
       "- Invoice Accounting"."Invoice Currency Name" as "Invoice
Currency Name"
from "Payables Invoices - Transactions Real Time"."- Invoice Accounting"
"- Invoice Accounting"
where "- Invoice Accounting"."Ledger Currency Name" = :IA_NAME
```

3. **Important:** the alias in the WHERE clause must match the FROM clause exactly: "- Invoice Accounting" (with the dash and the space). Writing "Invoice Accounting" without the dash gives an error.
4. Click **OK**. Wait while it shows "Processing…".

C. Create the parameter

1. The **Add Parameter** window appears: "Please select one or more bind variables to create corresponding parameters".
2. Make sure **IA_NAME** is checked, then click **OK**.
3. In the left pane, click **Parameters > IA_NAME** and check its settings:
   - **Name:** IA_NAME
   - **Data Type:** String
   - **Default Value:** empty
   - **Parameter Type:** Text
   - **Mandatory:** unchecked
   - **Display Label:** IA_NAME
4. Click the **Save** icon (top right) to save the data model.

D. Test the Data Model

1. Click the **Data** tab. The IA_NAME text field now appears above the buttons.
2. Type a value, for example **US Dollar**, and click **View** to see the filtered data.

E. Run the Report with the parameter

1. Go to **Catalog > My Folders > KA**.
2. Under **REPORT_ABSENCEMGMT_BU**, click **Open**.
3. The parameter IA_NAME appears at the top of the report. Type **US Dollar** and click **Apply**.
4. Result: the report shows only the rows where Ledger Currency Name = US Dollar (Ledger Currency = USD).

Summary

- **Parameter:** add where <column> = :PARAM_NAME to the data set SQL, then click OK, check the bind variable, Save, and Apply the value in the report.
